HEALTH EVIDENCE NETWORK SYNTHESIS REPORT 67

What is the evidence on the role of the arts in improving health and well-being?

A scoping review

*"Bringing art into people's lives through activities including **dancing**, **singing**, and going to museums and **concerts** offers an added dimension to how we can improve physical and mental health"*

Dr Piroska Östlin, WHO Regional Director for Europe

„The art of life and death“

RESEARCH

The art of life and death: 14 year follow-up analyses of associations between arts engagement and mortality in the English Longitudinal Study of Ageing

Daisy Fancourt,[1] Andrew Steptoe[1]

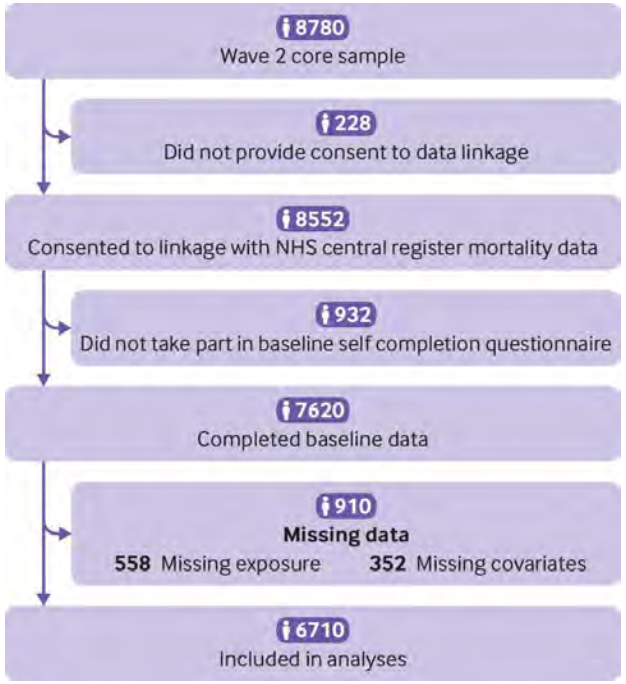
ABSTRACT

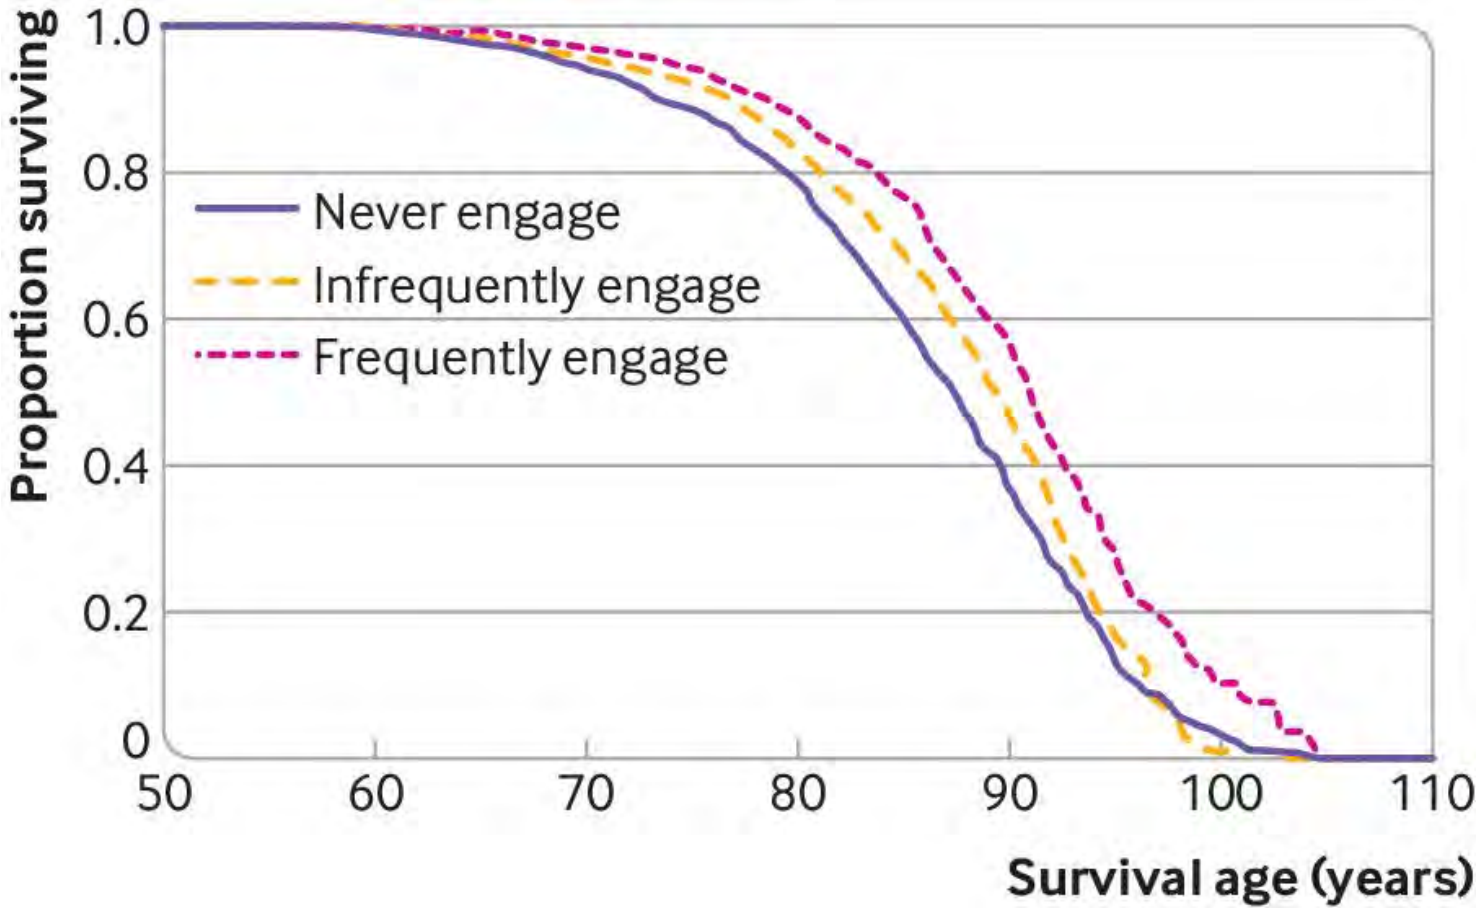
OBJECTIVE

To explore associations between different frequencies of arts engagement and mortality over a 14 year follow-up period.

DESIGN

of demographic, socioeconomic, health related, behavioural, and social factors. Results were robust to a range of sensitivity analyses with no evidence of moderation by sex, socioeconomic status, or social factors. This study was observational and so causality cannot be assumed.





Was ist Musik?

Plato definiert Musik als moralisches Gesetz,

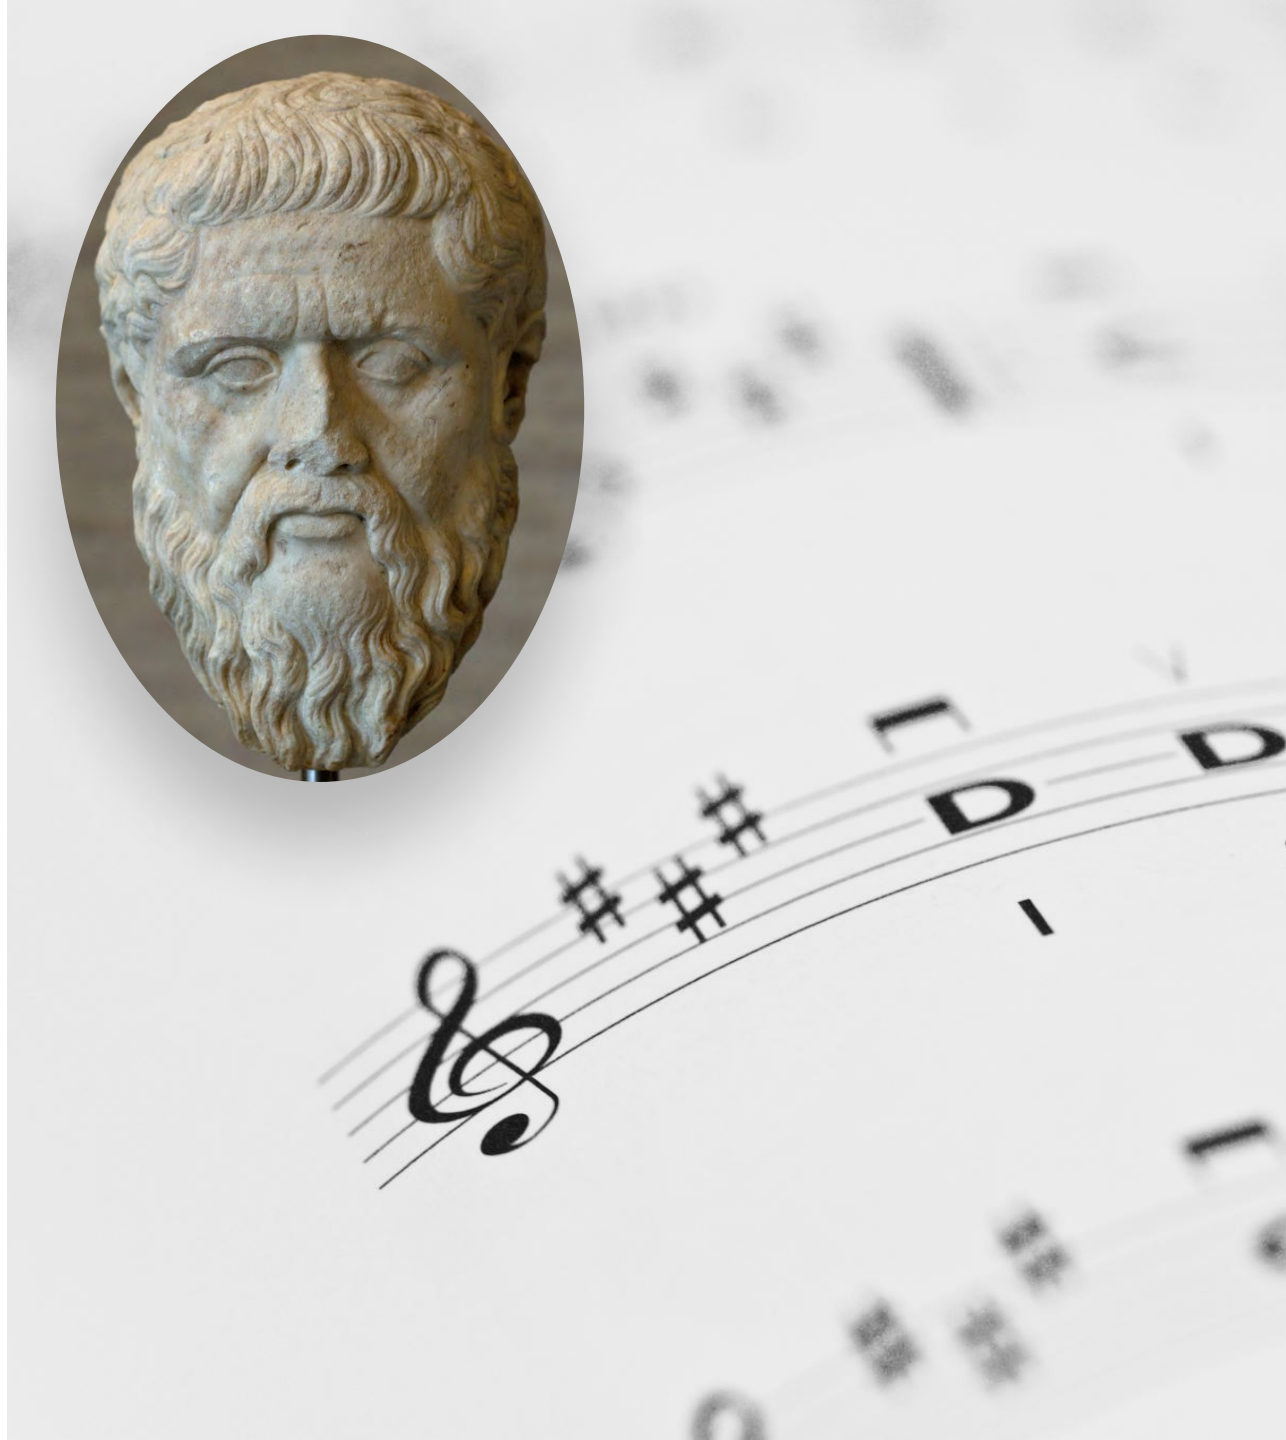
das dem Universum eine Seele verleihe und dem Geist Flügel,

der Fantasie Flugkraft,

der Traurigkeit einen Zauber und allen Dingen Freude im Leben.

Musik sei der Inbegriff der Ordnung und führe zu allem, was gut, gerecht und schön sei.

Die **theoretische Physik** definiert Musik als in zeitlicher Abfolge laufende Geräusche, die beim Zuhörer komplexe Assoziationen bewirken.



Musik & Gesundheit

Der Arzt Johann Wittich von Arnstadt (1537 – 1596) fasste die Voraussetzung für eine gute Gesundheit prägnant zusammen:

"*Das Hertz zu erfrewen/*
und allen Unmuht zu wenden/
haben sonderliche große Krafft dies fünff Stück

(i) Gottes Wort
(ii) Ein gutes Gewissen
(iii) Die Musica
(iv) Ein guter Wein
(v) Ein vernünftig Weib“

The Influence of In-Store Music on Wine Selections

Adrian C. North, David J. Hargreaves, and Jennifer McKendrick
University of Leicester

This field study investigated the extent to which stereotypically French and German music could influence supermarket customers' selections of French and German wines. Music with strong national associations should activate related knowledge and be linked with customers buying wine from the respective country. Over a 2-week period, French and German music was played on alternate days from an in-store display of French and German wines. French music led to French wines outselling German ones, whereas German music led to the opposite effect on sales of French wine. Responses to a questionnaire suggested that customers were unaware of these effects of music on their product choices. The results are discussed in terms of their theoretical implications for research on music and consumer behavior and their ethical implications for the use of in-store music.

Synchronisation of heartbeat rates during singing

The effect of music on the human body is a phenomenon whose underlying processes are still poorly understood. Nevertheless, growing experimental evidence attests that music might actually modulate physiological functions and elicit biochemical effects (Cervellin & Lippi, 2011). The human heart plays a central role in this context. Together with the respiratory system, with which it is coupled by an effect called respiratory sinus arrythmia (RSA) (Ludwig, 1847), the heart functions as the engine of our lives by keeping our body's energy supply running. In addition, it acts as a sensory organ in a physiological sense (Shepherd, 1985), but also on a metaphorical level. For example, we speak of "something going to our heart" when it touches us emotionally.

The Cardiovascular Effect of Musical Genres—A Randomized Controlled Study on the Effect of Compositions by W. A. Mozart, J. Strauss, and ABBA by Prof. Dr. med. Hans-Joachim Trappe, and Dr. med. Gabriele Voit in issue 20/2016

Möckel, M; Vollert, J O

Article | References | Metrics

Trappe and Voit's article picks up an interesting old topic but has methodological limitations (1). The slight changes in blood pressure are of questionable relevance even though they reached significance, especially as the method for measuring blood pressure

Isolated diastolic hypertension, pulse pressure, and mean arterial pressure as predictors of mortality during a follow-up of up to 32 years

Timo E. Strandberg[a], Veikko V. Salomaa[b], Hannu T. Vanhanen[a], Kaisu Pitkälä[a] and Tatu A Miettinen[a]

Objective To compare mortality associated with various blood pressure components in middle-aged men during up to 32 years of follow-up.

Design A prospective cohort study.

confidence interval (CI) 2.00 to 2.86, and RR 1.39, 95% CI 1.04 to 1.87, respectively). Risk with IDH-2 (RR 1.14, 95% CI 0.77 to 1.69) was not statistically significant. SDH and IDH-1, but not IDH-2, were also associated with increased all-cause mortality risk. Use of antihypertensive medication did not explain the results.

Diastolischer Bluthochdruck

TABLE 2. Proportional-Hazard Regression Coefficients Relating Incidence of CHD to Single BP Components of SBP, DBP, and PP by Age Groups

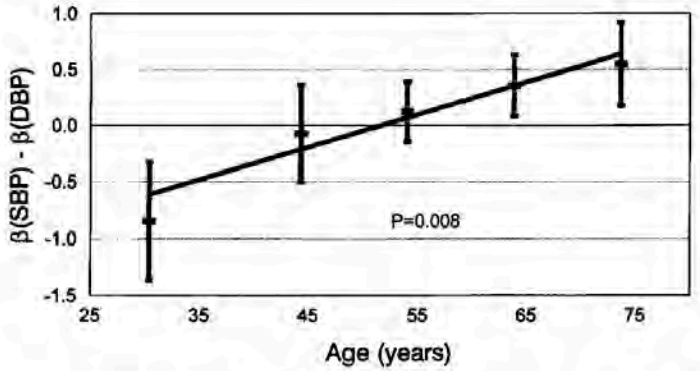
Single BP Components*	β†	SE†	Wald χ^2‡	HR (95% CI)†
Age <50 y				
SBP	0.13	0.04	10.8	1.14 (1.06–1.24)‖
DBP	0.29	0.06	21.8	1.34 (1.18–1.51)¶
PP	0.02	0.07	0.1	1.02 (0.89–1.17)
Age 50–59 y				
SBP	0.08	0.03	6.3	1.08 (1.02–1.15)§
DBP	0.10	0.06	2.9	1.11 (0.99–1.24)
PP	0.11	0.05	5.4	1.11 (1.02–1.22)§
Age ≥60 y				
SBP	0.16	0.03	30.0	1.17 (1.11–1.24)¶
DBP	0.11	0.06	3.2	1.12 (0.99–1.27)
PP	0.21	0.04	36.9	1.24 (1.16–1.33)¶

*SBP, DBP, and PP were entered in separate models, adjusted for age, sex, body mass index, cigarette smoking, diabetes mellitus, and ratio of total to HDL cholesterol.

†HR was associated with a 10 mm Hg increase in BP.

‡Wald $\chi^2=(\beta/SE)^2$.

§$P<0.05$, ‖$P<0.01$, ¶$P<0.001$.



Difference in CHD prediction between SBP and DBP as function of age. Difference in β coefficients (from Cox proportional-hazards regression) between SBP and DBP is plotted as function of age, obtaining this regression line: $\beta(SBP)-\beta(DBP)=-1.4948+0.0290\times age$ ($P=0.008$).

Secondary Analyses

During follow-up, 1728 subjects (26.4%) began antihypertensive treatment: 17.5% of subjects <50 years of age at baseline, 39.4% of subjects 50 to 59 years of age, and 42.8% of subjects ≥60 years. Analyses were repeated with postbaseline antihypertensive treatment entered as a time-dependent variable. Similar results were obtained with slight attenuation of the coefficients and probability value for the BP variables.

Does the Relation of Blood Pressure to Coronary Heart Disease Risk Change With Aging?

The Framingham Heart Study

Stanley S. Franklin, MD; Martin G. Larson, ScD; Shehzad A. Khan, BS; Nathan D. Wong, PhD; Eric P. Leip, MS; William B. Kannel, MD; Daniel Levy, MD

Background—We examined the relative importance of diastolic (DBP), systolic (SBP) and pulse pressure (PP) as predictors of coronary heart disease (CHD) risk in different age groups of Framingham Heart Study participants.

Methods and Results—We studied 3060 men and 3479 women between 20 and 79 years of age who were free of CHD and were not on antihypertensive drug therapy at baseline. Cox regression adjusted for age, sex, and other risk factors was used to assess the relations of BP indexes to CHD risk over a 20-year follow-up. In the group <50 years of age, DBP was the strongest predictor of CHD risk (hazard ratio [HR] per 10 mm Hg increment, 1.34; 95% CI, 1.18 to 1.51) rather than SBP (HR, 1.14; 95% CI, 1.06 to 1.24) or PP (HR, 1.02; 95% CI, 0.89 to 1.17). In the group 50 to 59 years of age, risks were comparable for all 3 BP indexes. In the older age group, the strongest predictor of CHD risk was PP (HR, 1.24; 95% CI, 1.16 to 1.33). When both SBP and DBP were considered jointly, the former was directly and the latter was inversely related to CHD risk in the oldest age group.

Conclusions—With increasing age, there was a gradual shift from DBP to SBP and then to PP as predictors of CHD risk. In patients <50 years of age, DBP was the strongest predictor. Age 50 to 59 years was a transition period when all 3 BP indexes were comparable predictors, and from 60 years of age on, DBP was negatively related to CHD risk so that PP became superior to SBP. (***Circulation***. **2001;103:1245-1249.**)

Key Words: blood pressure ■ hypertension ■ pulse pressure ■ coronary disease

Johann Sebastian Bach

- Geboren am 21. März 1685 in Eisenach, Deutschland.
- Einer der bekanntesten und einflussreichsten Komponisten der Barockzeit.
- Bekannt für seine technische Virtuosität und emotionale Tiefe.

Johann Sebastian Bach

- Geboren am 21. März 1685 in Eisenach, Deutschland.
- Einer der bekanntesten und einflussreichsten Komponisten der Barockzeit.
- Bekannt für seine technische Virtuosität und emotionale Tiefe.

Warum wirkt Bach's Musik subjektiv beruhigend?

- Strukturelle Klarheit: Bach's Musik ist durch eine klare Struktur und Ordnung geprägt, was ein Gefühl von Ruhe vermittelt.
- Langsames Tempo: Viele seiner Stücke haben ein Tempo, das zur Entspannung beitragen kann.
- Harmonische Komplexität: Die harmonischen Fortschritte in seiner Musik sind angenehm und beruhigend.
